CORPORATE HEADQUARTERS OAKLAND, CALIF.

Dr. E. R. Piore October 10, 1960

Subject: University of California Lawrence Radiation Laboratory
New York visit - October 20-21, 1960

Per our conversation of Friday, October 7, I am confirming the arrangements for a visit of personnel from subject customer. The group will include Dr. Sidney Fernbach, Messrs. James Norton, William MacNaughton, Jerry Russell and Kenneth Tiede.

On Thursday, October 20, it is planned to have these gentlemen engage in a research tour. Their very particular interest has reference to Superstretch components; in addition, they have high interest in input/output equipment and CRT's. Specifically then, we should give them as much information as possible in our developments in the following:

1. Cryogenics
2. Esaki diodes
3. High speed I/O equipment
4. CRT's

In this regard they have particular interest in color plus use of CRT's for both input and output.

The above areas are not meant to be self-limiting; if there are any other developments that are pertinent to high speed computers, we should make them knowledgeable.

Mr. N. Rochester has been the main contact with these people on our Superstretch negotiations.

On Friday, October 21, it is planned to have the above gentlemen meet with you at 590 Madison Avenue, at 10:00 a.m. You mentioned an interest in the bubble chamber work at LRL. Mr. Jerry Russell is directly connected with this work. His immediate superior is Mr. James Norton. On this basis, I believe it proper for all the LRL people to meet with you Friday. Further in this regard Dr. Fernbach advised me that a group of LRL personnel were planning to meet with IBM representatives in New York on Saturday, October 22, to discuss their work with the bubble chamber.

In the Friday, October 21, meeting, Dr. Fernbach would like to discuss possibilities of a grant to LRL for research in computer component development, mathematics and other phases of long term computer development.

We are nearing a satisfactory conclusion in our Stretch negotiations. I hope they are finalized by October 20. Further, our stake in the Superstretch area is substantial. The visiting LRL people are the decision-makers of this organization. I recommend that they be given as much information as possible during this visit, particularly in view of special treatment they have received from other manufacturers.

Mr. T. W. Cummins, who heads our efforts at the University of California, will accompany the group.

We will welcome your suggestions regarding this visit. Please indicate the probable location of Thursday's activities. They would like to see the Stretch assembly at Kingston on this date if time and distance permit.

R. L. Kocher
