STRETCH COMPUTER PASSES ACCEPTANCE TEST AT LOS ALAMOS

Last month the first STRETCH computer was shipped to the Los Alamos Scientific Laboratory. Last week the computer passed its acceptance test.

The system is now in use by the laboratory. Mr. Bengt Carlson at the Los Alamos laboratory called STRETCH "a very powerful computer, in my opinion the most powerful that is likely to appear for several years."

STRETCH is the fastest and most powerful computer in the world. The basic execution speeds of about 1.5 microseconds per addition and about 2.7 microseconds per multiplication are the fastest available. The system can perform 40 million additions or 22 million multiplications a minute. Overall problem solving capability is considerably greater than that of any other computer.

On May 15, IBM brought to a close its special STRETCH marketing program with firm commitments for seven additional systems.

Among the orders made public include the Atomic Energy Commission for the Lawrence Radiation Laboratory, C-E-I-R and the United Kingdom Atomic Energy Authority.
