P. P. Dept Meeting

Nate Edwards, Standardization Nov 3, '58

3 Point Program
1. Modularity
2. Automation
3. Flexibility

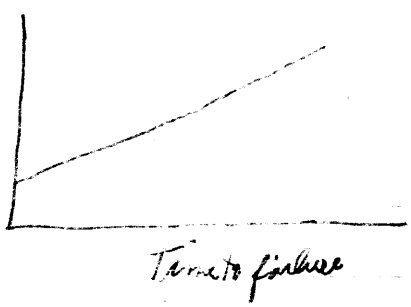

1957 Revenue

44 M small auxiliary machines,
accting machines
calculators.

Transistor elements – fewer resistors etc

Standard Package
1. card – single sided – printed on one side — 30 ¢ ea (w/o Transistors)
2. Logic blocks – . panels. — main part-spare part storage.
3. Std. gate.
4. cube, slide, large frame, etc. — eventually whole panels should be replaceable – by customer?

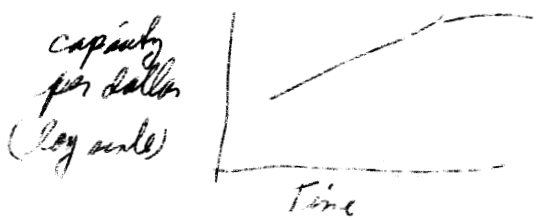

Records: 3 to 6 mos. between errors.
Athena 200 hrs.
Transac 1000 6 mos.

Time to repair 

due to distance + lack of experience,

- Automation of design + records
  - "Tayla-made" machines ?
- cost breakdown - active elements are highest for transistors
  all others are cheaper,

  eg. 27% is power supply.

- important to get in early on new generation — + get cost down.
  be ready when economic "threshold" is reached.

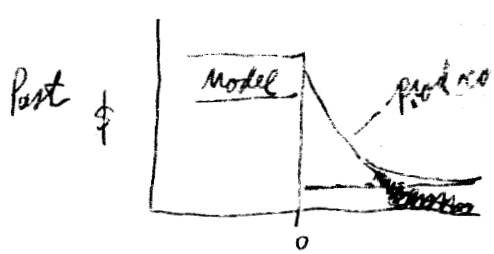

Standard:

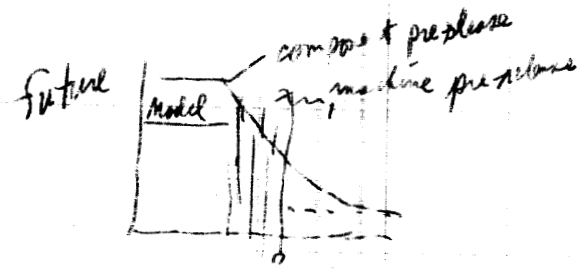

1. Ceramics	Stringfellow	Pub 15, Ed 5, SJ 2
2. Memory	Engr.	19, 0, 0
3. Power Supplies	Weaver	Pub 0, 10, 0
4. Frames + Covers	Bell Canada	
(5. Std. Engr,	Pub 31, Ent. 26, SJ. 1, Rad. 1)	

1958 Engr. Charge

Transistors 410,000

cards, 9,000

In 1950. 3000 tubes was limit

1952. 10,000 tubes " " (STAGE 60,000)

1958. 150,000 tubes.

Engr - Pros + Cons

Cons (1) No machine design optimum

(2) Limits designer prerogatives

(3) Greater Exposure

(perf. - vs std designers)

Pros. (1) constrain design effort

(2) Facilitate design + needs automation

(3) Cut Prod. lead time

(4) More uniform quality

(5) cut design & model costs.

Prod. Planning

- Std. function ← new area of importance
- Product timing
- updating of products

— limp along machine —
