MEMO TO: Mr. C. M. Pietras

SUBJECT: Resetting of Odd-Even Parity and High-Low Density Triggers in 729 Tape.

The present definition of the 729 Tape as planned for the Stretch system (with a byte converter) does not specify the reset state of the odd-even parity and high-low density triggers. This memo confirms the agreement concerning the above subject which has been reached in recent discussions:

When the power in the tape system is turned on, the tape control unit will be reset to read and write

1. without the ECC bits and with odd parity (No-ECC Mode and Odd Parity), and

2. at a density of 556 bits per inch (High-Density Mode).

The resetting to the high density mode applies also to the Stretch 729 Tapes which do not have byte conversion.
