January 28, 1959

MEMO TO: Mr. C. B. Poland

SUBJECT: Capacity of the Basic Exchange

REFERENCE: Your memo dated January 26, 1959

1. Your careful review of the revised Project 7000 manual Chapter 6 and pertinent comments are appreciated.

2. Clarification of the points raised in your memo is achieved by re-writing the definition as follows.

> "Channel B: This channel is 17 bits wide, accommodating 16-bit bytes and a parity bit to check transmission over the channel. Four such bytes make up a full memory word. The nominal rate is one byte every 8 microseconds or one word every 32 microseconds."

3. Page 6.5 last paragraph lines 5,6,7,8:

> "In the case of Type B channels, the nominal data transmission rate of the channel is one 16-bit byte per 8 microseconds. As far as exchange load is concerned, this transmission rate has a nominal weight of 4."

4. Page 6.7 "Summary of Exchange Capacity".

> "Type B Channel: Byte size = 16; Usec. per byte = 8; Bytes per second = 125,000; Usec per word = 32; Words per second = 31,250.
